## Two colors P29033_en

Examen final d'Algorísmia, FME (2014-01-16)

Write a program that, given an undirected graph, tells if we can paint all vertices with only two colors, in such a way that no two neighboring vertices have the same color.

### Input

Input consists of several cases, each with the number of vertices $n$ and the number of edges $m$, followed by $m$ pairs $x$ $y$ indicating an edge between $x$ and $y$. Suppose $1 \leq n \leq 10^4$, $0 \leq m \leq 5n$, that vertices are numbered from 0 to $n-1$, $x \neq y$, and that there is no more than one edge between any pair $x$ $y$.

### Output

For every case, print "`yes`" if the graph is two-colorable, and "`no`" otherwise.

### Sample input

```
2 1
0 1

4 3
1 2  3 2  3 1

1 0

4 2
0 3  2 1
```

### Sample output

```
yes
no
yes
yes
```
