
Resistant dichotomic search

P33412_en

Write an efficient function

```
bool resistant_search (double x, const vector<double>& v);
```

that tells if x belongs to the vector v or not.

Precondition

The vector v is “almost sorted” in nondecreasing order, in the sense that there may be at most a pair of indices i and j such that $0 \leq i < j < n$ and $V[i] > V[j]$.

Observation

You only need to submit the required procedure; your main program will be ignored.
