## Bridges

Catorzè Concurs de Programació de la UPC - Final (2016-09-21)
A bridge of an undirected graph is defined as any edge whose removal increases the number of connected components. Please compute all the bridges of a given graph.

## Input

Input consists of several cases, each with the number of vertices $n$, followed by the number of edges $m$, followed by $m$ pairs $x y$ indicating an edge between $x$ and $y$, with $x \neq y$. Assume $2 \leq n \leq 10^{4}, 1 \leq m \leq 5 n$, that vertices are numbered starting from zero, and that there is at most one edge connecting any pair of vertices.

## Output

For every graph, print the number of bridges, followed by a line with those bridges. The two vertices of each bridge must be sorted increasingly, and the bridges themselves must also be sorted increasingly. Print a line with 10 dashes at the end of every case.
