
Read a rational number (1)

P59652_en

Write a procedure

```
void read_rational (int& num, int& den);
```

to read a rational number given in the form “numerator”/“denominator”, and store these two values in *num* and *den*, respectively. Additionally, you must remove all common factors from *num* and *den*. For instance, if the input has

66/12

the values after the call must be $num = 11$ and $den = 2$.

Precondition

$1 \leq num \leq 10^9$ and $1 \leq den \leq 10^9$

Observation

You only need to submit the required procedure; your main program will be ignored.
