
String rotations

P62097_en

Dissetè Concurs de Programació de la UPC - Final (2019-09-18)

Given a string s of size n , we define the i -th rotation of s (for $0 \leq i < n$) as

$$s_i s_{i+1} \dots s_{n-1} s_0 \dots s_{i-2} s_{i-1} \dots$$

Given two strings s and t , compute how many i -th rotations of s are equal to t .

For instance, for $s = \text{"abbabb"}$ and $t = \text{"babbab"}$ the answer is 2, corresponding to $i = 2$ and $i = 5$.

Input

Input consists of several cases, each one with two strings s and t with only lowercase letters. Assume $1 \leq |s| = |t| \leq 10^5$. Every letter appears the same number of times in s and in t .

Output

For every case, print the number of i -th rotations of s that are equal to t .

Sample input

```
abbabb babbab
abc acb
abba bbaa
zzzzz zzzzz
```

Sample output

```
2
0
1
5
```
