Christmas gift   P74421_en

Setè Concurs de Programació de la FME (2010-12-21)

It is December 24th evening. An absent minded farmer has just realized that he did not buy any gift for his wife. The farmer is on a path in the woods, and he can only think about picking up all the mushrooms on the way back home, praying that that will soften a bit the cries awaiting him. Suppose the path divided into n segments $1, 2, \ldots n$, and that in each one there are a certain number of mushrooms m_i. The farmer is at the segment f, and his home is at the segment h. The farmer will pick up all the mushrooms in the segments between f and h. How many mushrooms will it be?

Input

Input consists of several cases. Every case begins with n, followed by the n quantities of mushrooms m_i. Follow the number of queries q about this case, assuming different positions of the farmer and his home. Each query consists of f and h, both between 1 and n. Suppose $1 \le n \le 10^5$, $0 \le m_i \le 1000$, and $q > 0$.

Output

For every case, print its number. For every query of every case, print the sum of the numbers between f and h, the extrems inclusive.

Sample input

```
4   7 0 20 105
3
1 4
3 3
4 3
1   1000
1
1 1
```

Sample output

```
#1
132
20
125
#2
1000
```
