## Substring search <br> Quart Concurs de Programació de la UPC - Final (2006-10-04)

You are given a string $s$ and many short patterns, all of the same length. The string $s$ and the patterns are composed only of ' $a$ ' and ' $b$ ' characters. For every given pattern, you must tell how many times it is included in $s$. Can you do it efficiently, both in time and in space?

## Input

Input starts with a number $t$, followed by $t$ cases. Each case begins with a non-empty string $s$, followed by a number $p \geq 1$, followed by $p$ non-empty patterns. The only characters in $s$ and in the patterns are ' $a$ ' and ' $b$ '. The length of $s$ is at most $10^{6}$. All the patterns of the same case have the same length, which is at most 60 . No given pattern is longer than $s$.

## Output

For every case, print the case number starting at 1 followed by the number of times that each given pattern is included in $s$. Print a blank line after every case.

## Sample input

2
aabaaaabaaab
3
aaba
aaaa
baab
b.b.b.b.b.bb

1
bb

## Sample output

Case 1:
2
1
0
Case 2:
7
