Perfect primes

P90664_en

Primer Concurs de Programació de la FME (2004-04-29)

Given a natural number n, let s(n) be the sum of the digits (in base 10) of n. We say that n is a *perfect prime* if the infinite sequence formed by n, s(n), s(s(n)), ... only contains prime numbers. For instance, 977 is a perfect prime, because 977, as well as 9+7+7=23, 2+3=5, 5, 5, ... are prime numbers.

Input

Each line of the input contains a number $1 \le n \le 4000000$. A line with n = 0 marks the end of the input.

Output

For each n, print in a line "yes" or "no", depending on whether n is a perfect prime or it is not.

Sample input	Sample output
977	yes
1	no
7	yes
17	no
0
