## First names

X18857\_en

---

Design the function *primers\_noms*(*f*, *n*) that returns a list of male nouns. Function parameters are a list of strings *f* and a non negative integer *n*. The result list must contain the first *n* male nouns in *f*. If there are less than *n* male nouns the function must return a list with those male nouns and at the end the string 'i cap mes'.

```
def es_nom_de_noi(s):
    return s in ['Albert', 'Antoni', 'Lluis', 'Marc',
                'Pere', 'Pol', 'Ramon']
```

## Sample session

```
>>> primers_noms(['Ramon', 'Laia', 'Gina', 'Alba', 'Aina', 'Lluis'], 2)
['Ramon', 'Lluis']
>>> primers_noms(['Ramon', 'Laia', 'Gina', 'Alba', 'Aina', 'Lluis'], 3)
['Ramon', 'Lluis', 'i cap mes']
>>> primers_noms(['Laia', 'Gina', 'Alba', 'Aina'], 2)
['i cap mes']
>>> primers_noms(['Pere'], 0)
[]
>>> primers_noms([], 5)
['i cap mes']
```
