
Operator list**X54712_en**

Write a function *operate*(*data*, *ops*) that applies in turn the operators listed in *ops* to the *data*. The data is a list of $n > 0$ integers. Then *ops* is a string of length $n-1$ made up of the characters '+' and '*' standing respectively for sum and product. The result of the function is to be the outcome of the operations in left-to-right order both of *ops* and of *data*: the first operator is applied to the first two integers, the second operator is applied to the outcome and the third integer, and so on.
