Operator list   X54712_en

Write a function $operate(data, ops)$ that applies in turn the operators listed in ops to the $data$. The data is a list of $n > 0$ integers. Then ops is a string of length $n - 1$ made up of the characters '+' and '*' standing respectively for sum and product. The result of the function is to be the outcome of the operations in left-to-right order both of ops and of $data$: the first operator is applied to the first two integers, the second operator is applied to the outcome and the third integer, and so on.
