## Lista de actividades

X71187\_es

---

Al final de este enunciado podeis encontrar un programa a medio hacer que hay que completar. Concretamente, hay dos funciones que estan pendientes de implementar. A continuación se explica con qué datos trabaja el programa y qué tienen que hacer las funciones.

El programa trabaja con un tipo de datos `Activity`, que representa una actividad, que incluye el nombre de la actividad (`name`), el instante de tiempo de inicio de la actividad (`t1`), y el instante de tiempo de finalización de la actividad (`t2`). Para simplificar, `t1` y `t2` son variables enteras, y el programa siempre trabaja con actividades correctamente definidas cumpliendo  $t1 < t2$ :

```
struct Activity {
    string name;
    int t1, t2;
}
```

El programa también trabaja con un tipo de dato `ListActivities`, que representa una lista de actividades:

```
typedef vector<Activity> ListActivities;
```

Hay que implementar una función para verificar que dos actividades son compatibles en tiempo, es decir, que no se solapan. En el caso particular de que una de las actividades acaba exactamente cuando la otra empieza, se consideran compatibles.

```
bool compatibleActivities(Activity a, Activity b);
```

Además, hay que implementar otra función que recibe dos actividades y retorna cierto si la primera es menor que la segunda según el criterio que se describe a continuación. Una actividad es menor que otra si comienza estrictamente antes que la otra, o comienza a la vez que la otra y acaba estrictamente antes, o comienza y acaba a la vez que la otra pero su nombre es menor que el nombre de la otra en orden lexicográfico.

```
bool smallerActivity(Activity a, Activity b);
```

La función anterior se utiliza desde otro sitio del programa para ordenar todas las actividades.

Completad, entonces, el siguiente código inacabado para solucionar el ejercicio:

```
#include <iostream>
#include <string>
#include <vector>
#include <algorithm>

// Here you can add more includes if you wish.

using namespace std;
```

```

struct Activity {
    string name;
    int t1, t2; // t1<t2 must be satisfied for a correct activity
};

typedef vector<Activity> ListActivities;

// Auxiliary functions (you can add more functions if you wish)

// Pre: The input contains a description of an activity with the format:
//
//      name t1 t2
//
//      where name is a non-empty string with lowercase letters and t1<t2
// Post: Returns the activity read from the input adapted to the format of struct
Activity readActivity()
{
    Activity a;
    cin >> a.name >> a.t1 >> a.t2;
    return a;
}

// Pre: listactivities represents a list of correct activities
// Post: Prints all activities from first to last, one per line, and with the format:
//
//      name t1 t2
void printActivities(const ListActivities &listactivities)
{
    for (int i = 0; i < int(listactivities.size()); i++) {
        const Activity &a = listactivities[i];
        cout << a.name << " " << a.t1 << " " << a.t2 << endl;
    }
}

// Pre: a, b represent correct activities.
// Post: Returns true iff the activities have a compatible timeline,
//        i.e. they do not overlap in time.
//        Note: if one of them finishes exactly when the other starts, then they are compatible.
bool compatibleActivities(Activity a, Activity b)
{
    // Implement this function.
    // ...
}

// Pre: a, b represent correct activities.
// Post: Returns true iff one of the following conditions holds:
//
//      - a starts strictly before b.
//
//      - a and b start at the same time but a finishes before b.
//
//      - a and b coincide in start and end time, but a has lexicographically smaller name.

```

```

bool smallerActivity(Activity a, Activity b)
{
    // Implement this function.
    // ...
}

int main()
{
    ListActivities listactivities;
    string command;
    while (cin >> command) {
        if (command == "NEW") {
            listactivities.push_back(readActivity());
        } else if (command == "SORT") {
            sort(listactivities.begin(), listactivities.end(), smallerActivity);
        } else if (command == "PRINT") {
            cout << "Current list activities:" << endl;
            printActivities(listactivities);
            cout << endl;
        } else if (command == "CHECKCOMPATIBLE") {
            int i, j;
            cin >> i >> j;
            string namei = listactivities[i].name;
            string namej = listactivities[j].name;
            if (compatibleActivities(listactivities[i], listactivities[j]))
                cout << "Activities " << namei << " and " << namej << " are compatible"
            else
                cout << "Activities " << namei << " and " << namej << " are incompatible"
            cout << endl;
        }
    }
}

```

## Entrada

La entrada consiste en una lista de comandos para crear nuevas actividades, ordenarlas, escribirlas todas, y comprobar si dos de ellas son compatibles. No hay que preocuparse mucho por el main ya que se da hecho y se encarga de llamar a las funciones para gestionar los comandos.

## Salida

La salida muestra los resultados de los comandos. No hay que preocuparse sobre la salida porque el main que se da hecho ya se encarga de llamar a las correspondientes funciones para producir la salida.
