Hello world!   X71233_en

Test! Write a program that prints a line with the message "`Hello world!`".

Input

There is not input: the program does not read anything.

Output

Print exactly the required text in a line.

Observation

This problem is atypical, because we do not need to read any input, and we always print the same. It is very easy!

Sample input 1	Sample output 1
`Input does not matter.`	`Hello world!`

Sample input 2	Sample output 2
`Really: Input does not matter!`	`Hello world!`
