## Ranking

X79712\_en

---

Several friends are participating in a javelin competition. Once the competition has finished, write a program that prints the ranking of the participants according to their result.

### Input

The input starts with an integer  $N$ , the number of participants. On each of the following  $N$  lines is the name of a participant (as a single word) and the final score of this participant. If you wish, you may assume that each participant has a unique score.

### Output

Print an ordered ranking of the participants on the following format:

K. X: YY.YY

Here,  $K$  is the ranking of the participant (in the range 1 to  $N$ ),  $X$  is the name of the participant and  $YY.YY$  is their final score.

**Hint:** Use "std::setprecision" in the <iomanip> library to print a fixed number of decimal places:

```
std::cout << std::setprecision( 2 ) << std::fixed << result;
```

### Sample input

```
4
John 68.99
Emily 67.12
Richard 59.92
Jennie 60.01
```

### Sample output

```
1. John: 68.99
2. Emily: 67.12
3. Jennie: 60.01
4. Richard: 59.92
```
